SEEA-EEA Experimental biodiversity account for the Netherlands 2006–2013

Patrick Bogaart¹⁾,

Richard Verweij (and colleagues!)¹⁾, Chris van Swaay²⁾

¹⁾Statistics Netherlands ²⁾Butterfly conservation

MAIA Webinar 30 March 2019

Biodiversity indicators

CBD:

- Trends in **extent** of selected ecosystems
- Trends in **abundance** and **distribution** of selected species
- Trend in status of **threatened species**
- Changes in **genetic diversity**

SEEA-EEA:

- Tier 1: ecosystem **extent**
- Tier 2: species **richness**; extinction risk
- Tier 3: species **abundance**

Contents

- Extent
- Threatened Species account
- **Species abundance #1 (LPI)**
- Species abundance #2 (MSA)
- **Spatial diversity modeling**
- Main approach
 - Data from operational monitoring networks
 - And *some* validated citizen science data
 - Wrangling data into SEEA account moulds

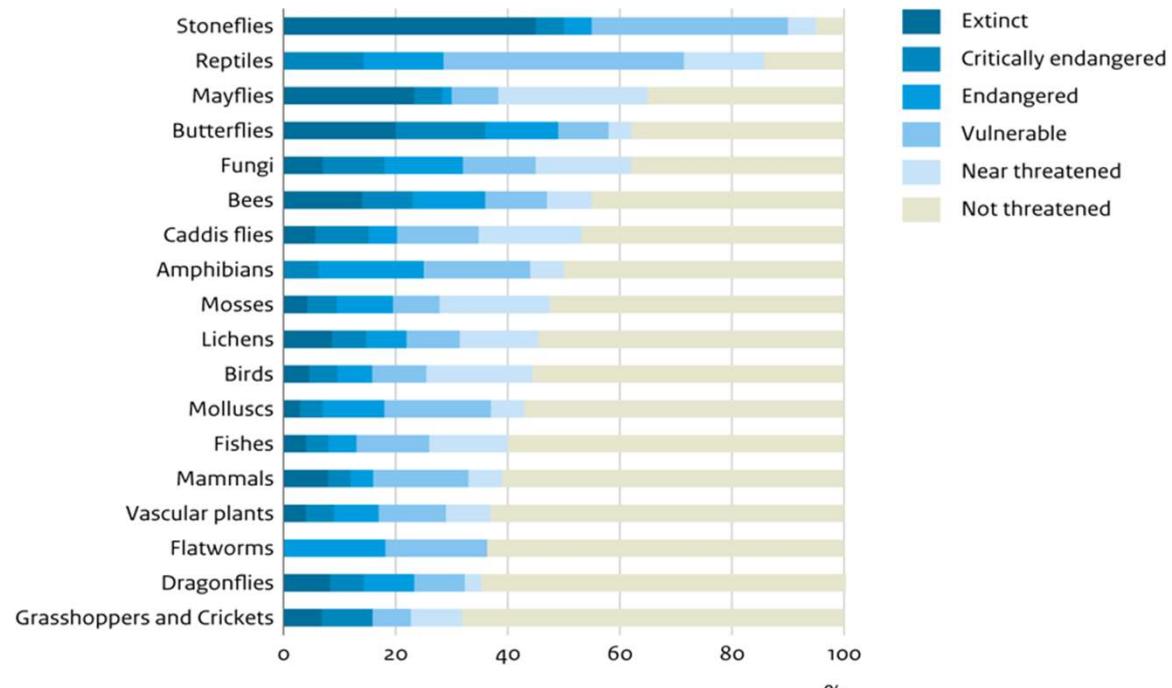

Ecosystem extent

Multi-species aggregation

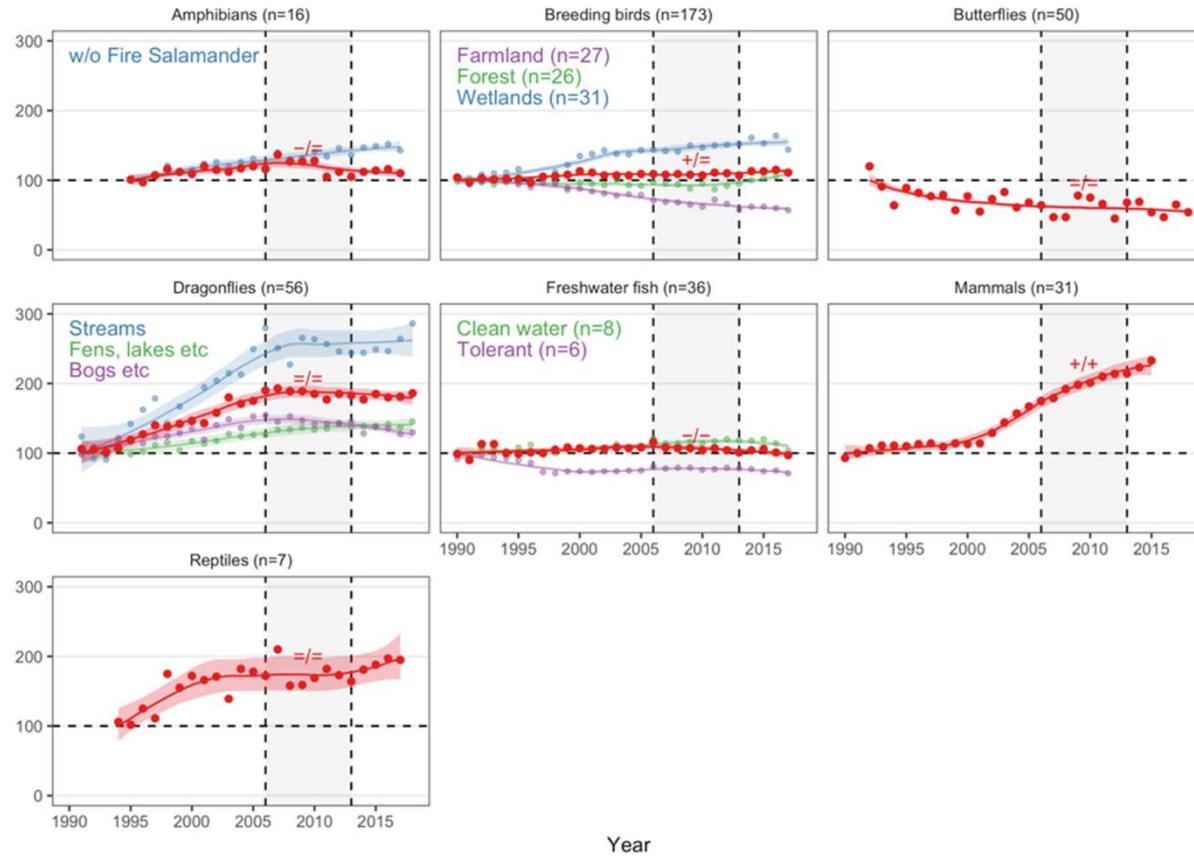

Species abundance changes: LPI

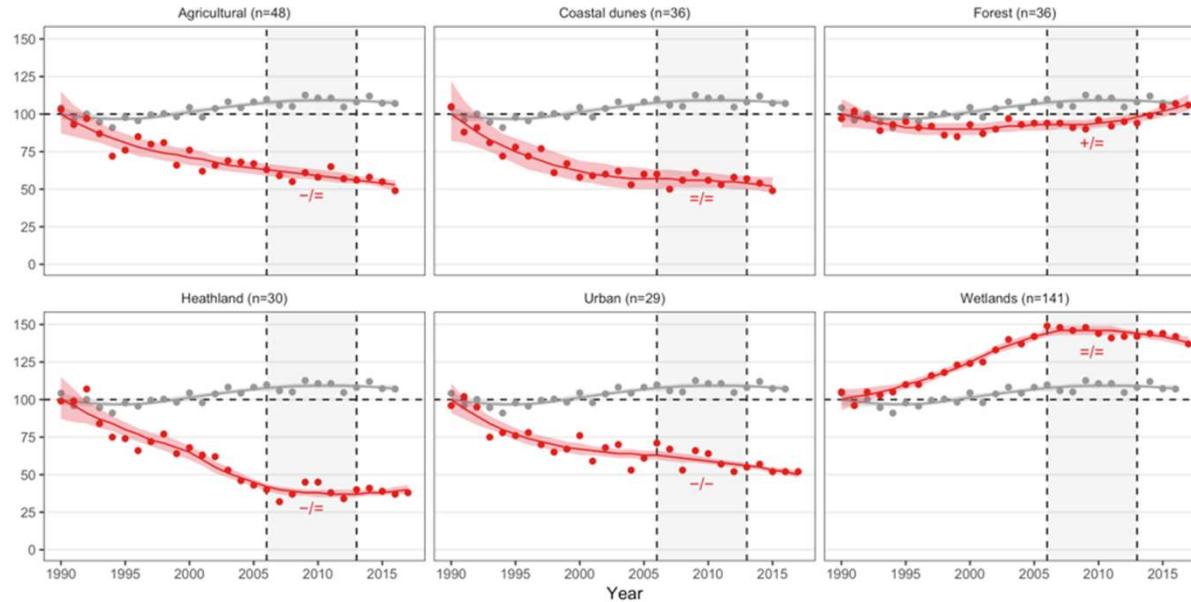

LPI per species group

Living Planet Index (per species group)
(1990=100)

LPI per ecosystem type

Living Planet Index (per broad ecosystem type)
(1990=100)

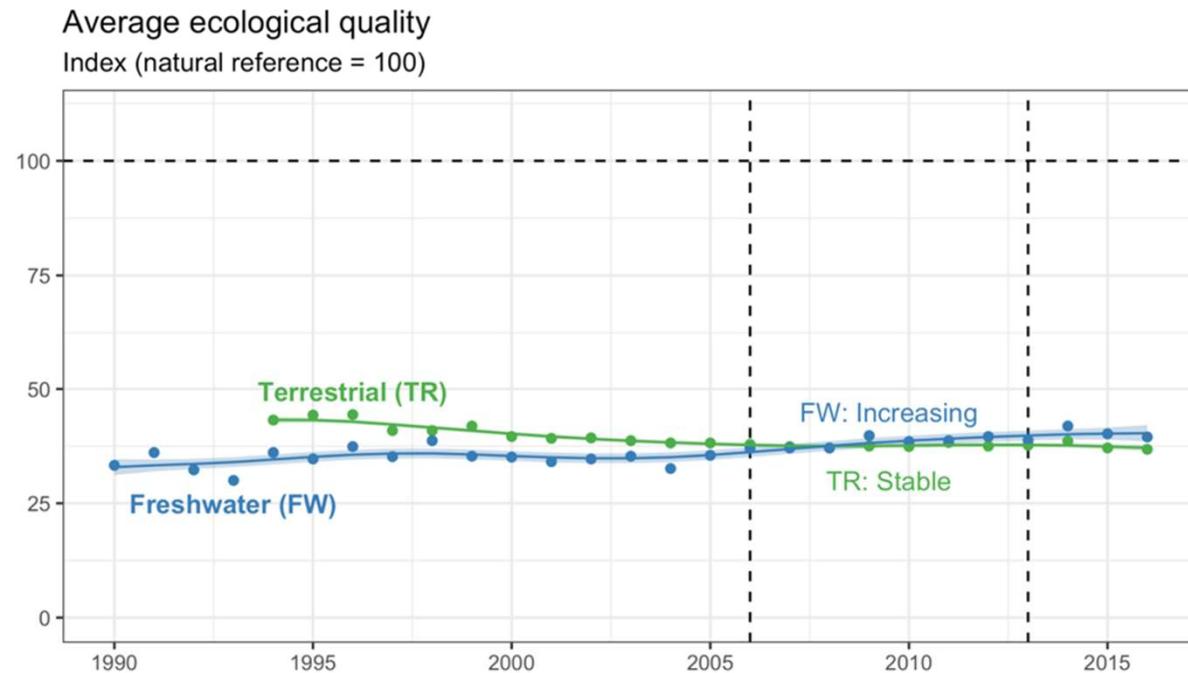

LPI account

Ecosystem (sub)type	Living Planet index			Change in LPI		
	CLO	2006	2013	Absolute	Relative	Assessment
All Terrestrial and Freshwater	1569	107.7	108.9	1.21	1%	Stable
Terrestrial	1579	85.0	87.0	2.0	2%	Stable
Terrestrial nature	1581	59.0	60.0	1	2%	Stable
Forest	1162	93.0	98.0	5	5%	Increasing
Open nature	1586	39.0	38.0	-1	-3%	Stable
Heathland	1134	42.0	37.0	-5	-12%	Decreasing
Coastal Dunes	1123	57.0	54.0	-3	-5%	Stable
Freshwater and wetlands	1577	144.0	144.0	0	0%	Stable
Agricultural	1580	63.0	56.0	-7	-11%	Decreasing
Urban	1585	63.0	56.0	-7	-11%	Decreasing

Alternative approach: Mean Species Abundance (MSA)

Integrated reporting

Ecosystem (sub)type	Extent			Living Planet index			MSA ecosystem quality		
	2006	2013	Change	2006	2013	Change assessment	2006	2013	Change assessment
All Terrestrial and Freshwater				107.7	108.9	1% Stable			
Terrestrial				85	87	2% Stable			
Terrestrial nature				59	60	2% Stable	37.8	37.8	0 Stable
Forest	326903	329540	1%	93	98	5% Increasing	32.3	35	8% Increasing
Open nature				39	38	-3% Stable			
Heathland	38343	41493	8%	42	37	-12% Decreasing	32.6	32.3	-1% Stable
Coastal Dunes	24010	22049	-9%	57	54	-5% Stable	47.1	43.9	-7% Decreasing
Semi-natural grassland	49841	57790	14%				29.2	33.4	14% Increasing
Freshwater and wetlands				144	144	0% Stable			
Freshwater	408344	421246	3%				36.2	39.8	10% Increasing
Wetlands	37006	47669	22%				47.5	45.9	-3% Stable
Agricultural	1867094	1822362	-2%	63	56	-11% Decreasing			
Urban	519289	546967	5%	63	56	-11% Decreasing			

Notes:

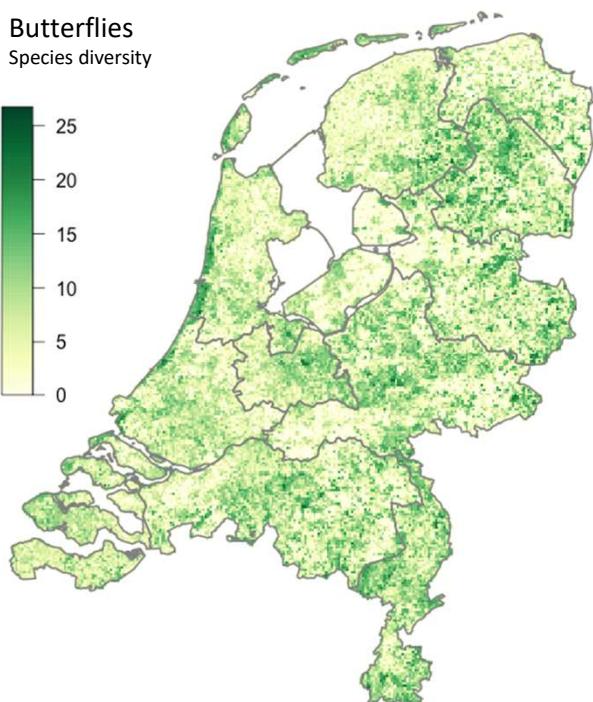

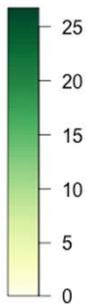

'Forest' includes permanently vegetated coastal dunes

'Urban' includes built-up environments and public green space

Ex. 2: agricultural ecological 'deserts'

Conclusion

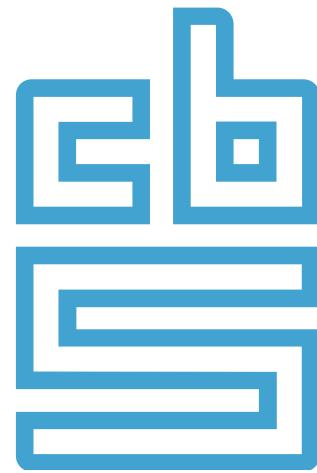

- SEEA-EEA **extent accounting** enables tier 1 biodiversity accounting (*extent*)
- **Expert-knowledge and some data** allows tier 2 biodiversity accounting (*species diversity; extinction risk*)
- Intensive (volunteer-driven) **monitoring programs** allow tier 3 accounting (*abundance trends*)
- **Dense monitoring + modelling** allow hi-res spatial analysis.

Follow-ups (considered for MAIA)

- Definitive approach to trend detection over accounting interval.
- Linking spatial biodiversity to landscape structure
 - Beta diversity
 - Rise of habitat generalists
 - Decline of habitat specialists
